## - INDEX -

**Chapter 1.** New generation of biosensitive hydrogels based on slide-rings for the label-free detection of biomolecules

*Aitor Cubells-Gómez, María Isabel Lucío, María-José Bañuls, Ángel Maquieira*

**Chapter 2.** Initial storage study of surface relief diffraction gratings based on hydrogels for their long-term use in label-free biosensing

*Ángela Sofía Ocampo-Amaya, María Isabel Lucío, Miguel Ángel González-Martínez, María-José Bañuls, Ángel Maquieira*

**Chapter 3.** Visual languages of popularisation, infography and perception

*Francisco Torrens, Gloria Castellano*

**Chapter 4.** Design and implementation of a freeze damage detection system in conference pears using electrochemical impedance spectroscopy

*Nestor Freixa Muñoz, Nicolás Laguarda Miró, Javier Ibáñez Civera, Rafael Masot Peris, Tomás Prieto Calabuig and Joan Medina Senabre*

**Chapter 5.** Visual detection of pathogen's DNA based on enzyme loaded nanoporous anodic alumina films

*Andy Hernández-Montoto, M. Nieves Aranda, Isabel Caballos, Alba López-Palacios, María Ángeles Tormo-Mas, Javier Pemán, Elena Aznar, Ramón Martínez Máñez*

**Chapter 6.** Analysis of different sensors and design of a portable device for early detection of freezing damage in Fuji apples

*Tomás Prieto Calabuig, Nicolás Laguarda Miró, Rafael Masot Peris, Javier Ibáñez Civera, Nestor Freixa Muñoz*

**Chapter 7.** Optimization and validation in a laboratory environment of biomarkers for the early detection of viable bacteria in the drinking water distribution network

*Gloria Pérez, Inmaculada Amorós, Laura Moreno-Mesonero, Román Fernández, Yolanda Moreno*

**Chapter 8.** Murine and porcine skin as surrogate models for studying the transdermal absorption of a hydrophilic drug loaded in lipid-based nanocarriers: ex vivo correlation

*Antonio José Guillot, Miquel Martínez-Navarrete, and Ana Melero*

**Chapter 9.** DNA biosensing systems for THINK in AZUL project. The future of pathogen detection in aquaculture

*Luis A. Tortajada-Genaro, Miguel Ángel González-Martínez, Francisco J. Espinós, and Ángel-Maqueira*

**Chapter 10.** Design of a study cell for macrocell current analysis in simulated concrete pore solution

*Josep Ramon Lliso-Ferrando, Manuel Valcuende, Isabel Gasch, Ana Martínez-Ibernón, José Manuel Gandía-Romero, José Roberto Vengut Tro, Juan Soto*

**Chapter 11.** Monitoring macrocell currents in reinforced concrete structures partially submerged in seawater

*Josep Ramon Lliso-Ferrando, Manuel Valcuende, Isabel Gasch, Ana Martínez-Ibernón, José Manuel Gandía-Romero, José Roberto Vengut Tro, Juan Soto*

**Chapter 12.** Development of biosensing platforms for sensitive and rapid detection of nosocomial pathogens in robotic surgery

*Pedro Quintero-Campos, Sara Martorell, Joaquín Castán, Susana Herrero, Ana Isabel Crespo, Emilio López-Alcina, Sergi Morais, Ángel Maqueira*

**Chapter 13.** Detection of a climate change marker (*vibrio vulnificus*) by a lateral flow test strip assay

*Pedro Quintero-Campos, Belen Fouz, Carmen Amaro, Luis Tortajada-Genaro, Ángel Maqueira*

**Chapter 14.** Assessing the relevance of stereoselectivity through physiologically based pharmacokinetic modelling: a case study with ibuprofen

*Marina Cuquerella-Gilbert, Javier Reig-López, Matilde Merino-Sanjuán, Víctor Mangas-Sanjuán, Alfredo García-Arieta*

**Chapter 15.** Dye-Displacement-Based Test Implemented in Lateral Flow Strips to Prevent GHB Spiking in Alcoholic Beverages.

*Guillermo Hernández-Sigüenza, Eva Garrido, Estela Climent, María D. Marcos, Knut Rurack, Félix Sancenón, Vicente Martí-Centelles, Ramón Martínez-Mañez*

**Chapter 16.** Towards a chemical communication network between bacteria and artificial cells.

*Jordi Ventura, Antoni Llopis-Lorente, Ángela Morellá-Aucejo, Beatriz de Luis, Sheref Mansy, R. Martínez-Mañez*

**Chapter 17.** Development of functionalised surfaces with natural antimicrobials to prevent bacteria adhesiveness in the food industry.

*Susana Ribes, Inés Fernández - Ateca Del Valle, José Manuel Barat, Édgar Pérez-Estevea*

**Chapter 18.** Electronic system for macrocell current measurement in reinforced concrete structures.

*Roberto Vengut-Tro, Vicente Beltrán-Morte, Josep Ramon Lliso-Ferrando, Ana Martínez-Ibernón*

**Chapter 19.** Low cost system for structural deformation measurement using strain gauges.

*Roberto Vengut-Tro, Vicente Beltrán-Morte, José Manuel Gandía-Romero, Ana Martínez-Ibernón, Josep Ramon Lliso-Ferrando, Javier Monreal-Trigo*

**Chapter 20.** Sistema de nariz electrónica para la detección de azadiractina – aceite de Neem.

*Luis Gil Sánchez, Cristian Olguín Pinatti, Ángel Hernaiz Martorell, Mirian Benítez*

**Chapter 21.** Postharvest treatments. Analytical strategy for the control of phytosanitary application in plants and fruits.

*Yeray Pallás-Tamarit, María José Bañuls, Sergi Morais, Ángel Maqueira*

**Chapter 22.** Universal Gratings of Proteins for Diffractive Biosensing.

*Arturo Patrone-Garcia, Augusto Juste-Dolz, Estrella Fernández, Miquel Avella-Oliver, Ángel Maqueira*

**Chapter 23.** Patterned Antibody Biolayers Generated by Selective Deactivation Via UV-Laser Irradiation.

*Arturo Patrone-Garcia, Augusto Juste-Dolz, Martina Delgado-Pinar, Estrella Fernández, Jose Luís Cruz, Miquel Avella-Oliver, Miguel V. Andrés, Ángel Maqueira*

**Chapter 24.** Construction of Biosensors based on G-Quadruplex DNAzymes.

*Blanca Martín, Luis A. Tortajada-Genaro, Ángel Maqueira*

**Chapter 25.** Antiviral Effect of Different Essential Oil Components (Eocs) on Bovine Coronavirus

*Héctor Gómez-Llorente, Édgar Pérez-Esteve, José M. Barat, Isabel Fernández-Segovia, Mette Myrnel*

**Chapter 26.** Development of a Paper-Based Immunoanalytical Method Governed by Electrophoresis

*Amadeo Sena-Torralba, Ana Hernanz-Grimalt, Javier Pérez, Javier Carrascosa, Sergi Morais, and Ángel Maqueira*

**Chapter 27.** Development of a Sensitive Multiplexed Lateral Flow Microassay for Advanced Allergy Diagnosis

*Ana Hernanz-Grimalt, Amadeo Sena-Torralba, Sergi Moraisa, Ángel Maqueira*

**Chapter 28.** Bioanalytical Approaches Based on Phages for the Detection of Phytopathogenic Bacteria

*Javier Pérez-Garreta, Amadeo Sena-Torralba, Ana Hernanz-Grimalt, Ángel Maquieira, Pilar Domingo Calap, Sergi Morais*

**Chapter 29.** Towards PBPK Modelling for Oral Absorption in PhysPK

*Marina Cuquerella-Gilabert, Javier Reig-López, Jenifer Serna, Almudena Rueda-Ferreiro, Matilde Merino-Sanjuan, Sergio Sánchez-Herrero, Victor Mangas-Sanjuan*

**Chapter 30.** CMOS BOOST Converter for Infrared Energy Harvesting to Supply Intelligent Drug Release Microdevices

*Vicente Beltrán-Morte, Javier Monreal-Trigo, Miguel Alcañiz-Fillol, Vicente Herrero-Bosch, Roberto Vengut-Tro*

**Chapter 31.** Sensores de Temperatura Realizados PEDOT-PSS Impresos con Técnicas Serigráficas

*José V Lidón-Roger, Eduardo Garcia-Breijo, Miguel Alcañiz-Fillol, Cristian Olguín-Pinatti, Ángel Tébar Ruiz*

**Chapter 32.** Fluorescent Lateral Flow Immunoassay Based on Perovskite Nanoparticles

*Pilar Martínez-Herrero, William Teixeira, Cynthia Collantes, Javier Carrascosa, Amadeo Sena-Torralba, Victoria González-Pedro, María-José Bañuls, Ángel Maquieira*

**Chapter 33.** Prototype for in Vivo Electrostimulation Delivery in Spinal Cord Injury

*Javier Monreal-Trigo, Miguel Alcañiz-Fillol, Vicente Beltrán-Morte, Roberto Vengut-Tro, José Manuel Terrés-Haro*

**Chapter 34.** Fully-Integrated Ultra-High Resolution Current Measurement System for Electrically Controlled Drug Release Technology Characterization

*Javier Monreal-Trigo, Miguel Alcañiz-Fillol, Vicente Beltrán-Morte, Roberto Vengut-Tro, José Manuel Terrés-Haro*

## DETECTION OF A CLIMATE CHANGE MARKER (*VIBRIO VULNIFICUS*) BY A LATERAL FLOW TEST STRIP ASSAY

**Keywords:** *Vibrio vulnificus* • Biosensor • DNA • Lateral flow • Climate change

### ABSTRACT

Climate change is causing rapid changes at all ecological scales, including coastal ecosystems. This situation alters the distribution patterns of some pathogens susceptible to these changes, which can be used as markers of climate change. One of the most critical aquatic pathogens in human health that is experiencing a growth parallel to the increase in coastal temperature is *Vibrio vulnificus*. This pathogen is associated with aquaculture and can be transmitted from diseased fish to humans (zoonosis). Currently, *V. vulnificus* is detected in water and animals by combining cultural and qPCR methods, which requires specialized personnel and equipment. It would therefore be interesting to have a rapid and accurate detection procedure that requires neither operators nor equipment in field conditions, and that could be implemented on a global scale to monitor both the pathogen and the progress of climate change.

This communication presents the development and fine-tuning of a simple and rapid detection method for *V. vulnificus* using PCR combined with a lateral flow device. The method was tested on fish samples. Preliminary results show that the limit of detection is 0.01% of pathogenic DNA vs. fish DNA with a total assay time of less than one hour. These results are promising and suggest that the new procedure could be used for aquaculture, climate change monitoring, and environmental remediation.

### INTRODUCTION

Climate change is affecting the planet in an unprecedented manner, causing rapid changes at all ecological scales. Changes in weather patterns due to global warming alter the infection patterns of some pathogens that are particularly sensitive to environmental changes. [1] The vibrios are an important group of aquatic pathogens experiencing rapid growth due to this situation. The genus *Vibrio* comprises more than 100 species that are natural inhabitants of warm water ecosystems of low to moderate salinity. [2]

The ecology of *Vibrio* is inextricably linked to two main environmental factors: seawater temperature and salinity. These two elements have been identified as the main components governing the distribution and abundance of *Vibrio* in coastal waters. [3] Basically, salinity defines the areas suitable for these organisms, while temperature modulates their abundance in areas suitable for their presence. [1]

Ocean warming, changes in precipitation, river runoff, and ice melt associated with climate change may lead to temporary reductions in salinity in many coastal areas, which could contribute to ideal environmental conditions for vibrio growth (Figure 1). As a result of these changing conditions, the number of days suitable for vibrio growth in water has increased considerably since a baseline in the early 1980s, and the overall

suitability for vibrio presence on the coast has increased by 9.9% during this period. [1] These associations have led to *Vibrio* species being collectively recognized as a "microbial barometer of climate change".

**Figure 1.** Correlation of *Vibrio* spp. abundance and effects of global warming on aquatic systems. Adapted from [3].

Among the species of the genus *Vibrio* most susceptible to climate change, *V. vulnificus* stands out as a zoonotic agent associated with cases of rapid death by septicemia in humans. This pathogen can infect both by contact with water or contaminated/diseased animals and by ingestion of raw or undercooked seafood [4]. So far, this pathogen is detected by combining cultural microbiological methods with qPCR detection. Consequently, it would be very interesting to develop rapid and accurate identification methods that would require neither trained operators nor equipment in field conditions and could therefore be implemented in developing countries not only to monitor the presence of the pathogen but also the progress of climate change.[5]

Considering the above, the aim of this work has been to develop one of these methods. The new approach combines PCR and lateral flow and detects and quantifies the presence of *V. vulnificus* DNA in less than 1 h.

## METHODOLOGY

### **DNA extraction**

Pure cultures of *V. vulnificus*, *V. harveyi*, *V. alginolyticus*, and *V. anguillarum* were obtained in LB-1 after 18 h of incubation at 28°C. Volumes of 1 mL of each culture were centrifuged at 12,000 rpm for 4 min at 4°C. Bacterial pellets were resuspended in 100 µL of PBS (Phosphate Buffered Saline 1 %, pH 7), boiled at 100°C for 5 min, kept on ice for 5–10 min and, then, centrifuged again at 12,000 rpm for 4 min at 4 °C (Gyrozen 1730R, Controltecnica, Spain). DNA present in the supernatant was stored at -20 °C and used as a PCR template. In parallel, DNA from blood cells of gilthead seabream was extracted using the same protocol. The DNA concentration and quality per sample was determined using NanoDrop 2000 (Thermo Fisher Scientific, Spain).

### **Amplification by PCR**

A forward and reverse primers set was designed targeting *V. vulnificus* and labelled at the 5' ends with fluorescein isothiocyanate (FITC) and biotin, respectively. The final conditions were set in a 12.5 µL volume containing 1.25 µL of PCR Buffer (Biotools, Spain), 0.55 µL of a 50-µM solution of MgCl<sub>2</sub> (ThermoScientific, EEUU), 0.25 µL of 10 mM-dNTPs (ThermoScientific, EEUU), 0.3 µL of each 10 µM-primer, 0.25 µL of Taq DNA polymerase (Biotools, Spain), 8.25 µL DNase-free water, and 1 µL of template. DNA from *V. vulnificus* was mixed in different ratios with DNA from gilthead seabream (1:1, 0.75:1, 0.5:1; 0.25:1, 0.1:1, 0.01:1 and 0.001:1) and the mixture was used as a template to establish the sensitivity of the assay. The selectivity of the method was determined using DNA extracted from other phylogenetically close pathogenic vibrios (*V. harveyi*, *V. alginolyticus* and *V. anguillarum*). The reactions were carried out in UNO96 thermocycler (VWR, EEUU).

### Lateral flow assay

A positive PCR generates amplicons labelled with FITC and biotin. The amplification product binds to the gold-labelled anti-FITC antibody in the strip and is immobilized to the streptavidin band of the test line, producing a positive band. The control band captures the unbound gold particles, resulting in a colored band at the end of the strip. The procedure was as follows: a volume of 2  $\mu\text{L}$  of the PCR products was mixed with 120  $\mu\text{L}$  Lateral Flow Assay Buffer (PBS-T) in a well of an ELISA plate. The Lateral Flow Strip was then immersed in the well, and the solution was allowed to flow through the strip for 5 minutes. The strip was then scanned, and the image obtained was analyzed using an image processor. The test was positive if a red band appeared at the bottom of the test strip and no band appeared on the negative control specimen. The detection limit of the lateral flow assay was determined by image analysis of the strip testing multiple dilutions of *V. vulnificus* DNA as a product.

## RESULTS

### DNA extraction

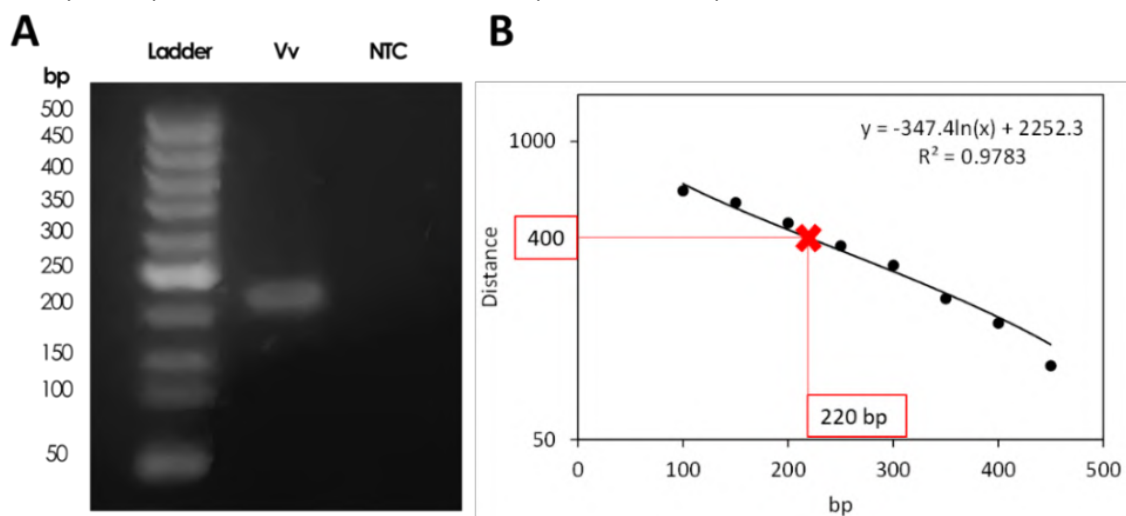

The concentration of bacterial DNA was measured by absorbance, and the purity of the DNA in each of the samples was determined using the A260/A280 and A260/230 ratios (Table 1):

**Table 1.** DNA concentration and quality analysis results.

Sample	[DNA] ng/ $\mu\text{L}$	A <sub>260/280</sub>	A <sub>260/230</sub>
<i>V. vulnificus</i> 1	177,9	1,86	2,22
<i>V. vulnificus</i> 2	88,1	1,91	2,45
<i>V. vulnificus</i> 3	106,3	1,91	2,30
<i>V. vulnificus</i> 4	215,9	1,91	2,10
<i>V. vulnificus</i> 5	120,1	1,85	1,86
<i>V. harveyi</i>	263,3	1,88	1,81
<i>V. alginolyticus</i>	178,9	1,89	1,81
<i>V. anguillarum</i>	84,0	1,95	2,95

### Amplification by PCR

As shown in Figure 2, PCR amplification of *V. vulnificus* using the labelled primers resulted in a fragment of approximately 220 bp. In the absence of DNA, no amplification was produced.

**Figure 2: Characterization of the positive amplicons.** A single band corresponding to the PCR amplification product of *V. vulnificus* was observed in 2% agarose gels (A). The band size was 220 pb (B). NTC: non-template control.

### Lateral flow assay

A schematic of the lateral flow DNA detection method is shown in Figure 3A. Application of this methodology to PCR products showed clear positive results for all samples containing *V. vulnificus* DNA but not for samples containing DNA from other species (Figure 3C). Next, we determined the detection limit of the procedure using samples containing bacterial and fish DNA in different proportions. As shown in Figure 3B, the detection limit is 0.01% which is equivalent to 0.05 ng of bacterial DNA per 49.95 ng of animal DNA.

**Figure 3:** (A) Schematic of the positive PCR detection method using a lateral flow device. (B) **Sensitivity study:** test strip after PCR amplification of target DNA diluted in non-target DNA (values in ng correspond to 100%, 75%, 50%, 25%, 10%, 1%, 1%, 0.1% of bacterial DNA vs. animal DNA). (C) **Selectivity study:** A positive band was observed only for *V. vulnificus* DNA. \*CL= Control Line, TL= Test Line.

### CONCLUSIONS

A simple and rapid method for the detection of *V. vulnificus* by PCR combined with a lateral flow test has been developed and fine-tuned. The designed primers allow the generation of double-labeled amplicons that can be detected with a lateral flow strip in less than 5 minutes, developing the complete protocol (including PCR) in less than 1 h. The test was specific for *V. vulnificus* and did not react with DNA from 3 other closely related vibrios (*V. harveyi*, *V. alginolyticus*, *V. anguillarum*). Preliminary studies conducted show that the detection limit of the pathogen DNA in relation to fish DNA is around 0.01%, a value that is within the detection limits of the pathogen in fish. Consequently, these results are promising and constitute the first step in developing and implementing a new rapid detection tool for this pathogen applicable out of the laboratory and in the field. This new tool would be useful not only for pathogen detection, but also for disease diagnosis and could eventually be used to monitor climate change, as *V. vulnificus* is a biomarker of global warming.

### ACKNOWLEDGMENTS

This study was supported by Spanish grants THINKINAZUL/2021/010 and THINKINAZUL/2021/027 from MCIN (Ministerio de Ciencia e Innovación de España) with funds from European Union NextGeneration EU (PRTR-C17.I1) and GV (Generalitat Valenciana), PID2020-120619RB-I00 funded by MCIN/AEI/10.13039/501100011033 and CIAICO/2021/293 funded by “Conselleria de Innovacion, Universidades, Ciencia y Sociedad Digital” (GV, Spain).
